

A man in a white shirt and tie is shown from the chest up, holding a rolled-up document in his right hand and an orange hard hat in his left hand. He is standing in front of a large industrial refinery with tall distillation columns and complex piping. The background is slightly blurred, emphasizing the man in the foreground. The overall tone is professional and industrial.

What is Brain Drain?

Brain drain is a slang term indicating substantial withdraw or movement of individuals. A brain drain can result from turmoil within a nation, the existence of favorable professional opportunities in other organizations or even countries, or from a desire to seek a higher standard of living. Brain drain may occur at the organizational or industrial levels when workers perceive better pay, benefits, or upward mobility within another company or industry.

Problems to Solve

1

Avoid key employees leaving the organization after a successful career and significant company investment.

3

Establish a path to success for key employees and track the evolution regularly in order to prevent premature resignation.

2

Determine key variables inside the organization and whether there is relationship with an employee's decision of leaving a company.

Project Objective

Use **machine learning** to analyze a key employee dataset in order to create a model capable of determining the **risk and probability** of an employee leaving the company.

OUR VARIABLES

1 Dataset Variables

Employee Type

There are different employee types in the organization:

1. Regular.
2. Commuter.
3. Expat.
4. Expat-ShortTerm/Dev.

Implications for client

The employee type has different salary scales and different priorities for the organization.

2 Dataset Variables Gate

Gate is a variable to determine the path to become a manager. Each employee has a gate value in relationship with degree and technical knowledge.

You enter the process based on your current job title and previous experience. You will only need to have assessments completed from your current Phase forward.

3 Dataset Variables

Gender

There are several employee types in the organization:

1. Male.
2. Female.

Implications for client

Oil industry has a historically higher male occupation.

4 Dataset Variables

Country

Oil company operates in a large number of countries:

- India.
- Malaysia.
- Brunei.
- Singapore.
- Japan.
- Myanmar.
- Thailand.
- Vietnam.
- South Korea.
- Bangladesh.

5 Dataset Variables

Scale

Hierarchy and importance inside the organization

1. Value from 4 to 31.

Observations:

31 is the highest value.

6 Dataset Variables

Comparatio

1. Value > 1 salary is higher than industry.
2. Value < 1 salary is lower than industry

Observations:

Compensation metric that compares the salary an employee is paid to the midpoint of the salary range for their position or similar positions at other companies.

& Dataset Variables Other Variables

Hierarchy and importance inside the organization

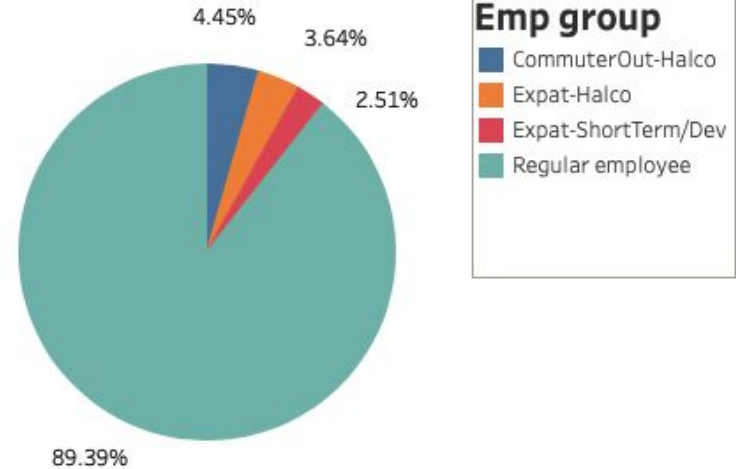

1. Promotions.
2. International Assignment.
3. Age.
4. Seniority.
5. Dependents.
6. Job Code.

Employee Group

- 1.Commuter Out
- 2.Expat
- 3.Expat Short term
- 4.Regular Employee

TYPE OF EMPLOYMENT

Seniority

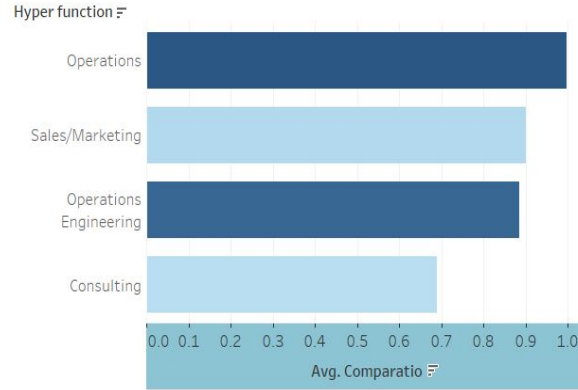

0-4 years: 547
4-8 years: 331
8-12 years: 201
12-16 years: 91

SENIORITY

Machine Learning

First Scenario (No Smote)

```
1    939
0    295
Name: Status, dtype: int64
```

CONFUSION MATRIX

Second Scenario

```
In [25]: # summarize class distribution
counter = Counter(y)
print(counter)

Counter({1: 939, 0: 939})
```

Accuracy = 0.88
Recall = 0.89

Conclusions

- Regular employees are prone to leave the company between 29 -35 years old
- Between 7-10 years of seniority the employees look other options
- Women are leaving the company after 35 year old
- Employees with more than 2 dependents prefer to stand at the company
- International assignments help to retain talent
- The company needs to focus on Gate 1 and 2, 85% of the separations are in these gates.

Thanks.
